Due to missing tests no recommendation to the glove material can be given for the product/ the preparation/ the chemical mixture.

Selection of the glove material on consideration of the penetration times, rates of diffusion and the degradation

Material of gloves

The selection of the suitable gloves does not only depend on the material, but also on further marks of quality and varies from manufacturer to manufacturer. As the product is a preparation of several substances, the resistance of the glove material can not be calculated in advance and has therefore to be checked prior to the application.

- Penetration time of glove material
 The exact break trough time has to be found out by the manufacturer of the protective gloves and has to be observed.
- For the permanent contact gloves made of the following materials are suitable: nitrile rubber; recommended glove thickness> 0.45mm. permeability / permeation time:> 480 min. according to EN 374.
- As protection from splashes gloves made of the following materials are suitable:
 Cloropene; handglove thickness >0.7mm, penetration time >60min.according EN374.
 Nitrilrubber; handglove thickness >0.3mm, penetration time >60min.according EN374.
